(57) **ABSTRACT**

In an embodiment, a support ring may include an arm and a hook. The arm may be located at a first end of the support ring. The arm may provide a spring force to a circuit board that is loaded in the support ring. The hook may be located at a second end of the support ring. The hook may extend upward from the support ring. The second end may be opposite the first end. The hook may provide a reaction force on the circuit board. The reaction forced may be a force in reaction to the spring force. The support ring may include one or more legs. The legs may extend downward from the support ring.

CLIP-IN SUPPORT RING

RELATED APPLICATIONS

This application claims priority to and the benefit of U.S. Provisional Patent Application No. 61/874,605, filed on Sep. 6, 2013 and titled "Clip-in Support Ring", the contents of which are incorporated by reference as though fully set forth herein.

BRIEF DESCRIPTION OF DRAWINGS

The accompanying drawings, which are incorporated in and constitute a part of this specification, illustrate one or more embodiments described herein and, together with the description, explain these embodiments. In the drawings:

FIG. 1 illustrates an example embodiment of a sensor device having an electronics module assembly (EMA) and a clip-in support ring;

FIG. 2 illustrates an example embodiment of a clip-in support ring that may be contained in the sensor device illustrated in FIG. 1;

FIGS. 3 illustrates an example placement of an EMA in the clip-in support ring;

FIG. 4 illustrates an example operation of the clip-in support ring; and

FIG. 5 illustrates an example technique for securing the clip-in support ring to a housing that may be contained in the sensor device illustrated in FIG. 1.

DETAILED DESCRIPTION

A sensor device such as, for example, a micro-strain gauge (MSG) device, may have an electronic module assembly (EMA). The EMA may be mechanically fixed above a diaphragm in the sensor device for wire-bonding. The EMA may be connected electrically to a housing associated with the sensor device for electromagnetic compatibility (EMC) performance.

Clip-in support rings described herein may be used to provide these functions in a device such as, for example, a sensor device. The clip-in support rings may, for example, provide fixation of the EMA by way of a spring force and a reaction force. Moreover, affixing (e.g., spot welding) a clip-in support ring described herein to a housing of the device may, for example, provide a robust mechanical and/or electrical connection to the housing. The electrical connection may provide electrical continuity between the EMA and the housing.

FIG. 1 illustrates an example embodiment of a sensor device 100 having an EMA 140 and a clip-in support ring 200. Referring to FIG. 1, sensor device 100 may include, for example, a connector 110, one or more contact springs 120, an environmental seal 130, EMA 140, clip-in support ring 200, a housing 160, and a sense element assembly 170.

The connector 110 may connect the sensor device 100 with an external source (e.g., an external computer). Connector 110 may include a terminal that may make, for example, electrical contact with an electrical conductor (e.g., an electrical wire) that may be connected to the external source. The terminal may, for example, be used to transfer signals that may be produced by the sensor device 100 to the external source via the electrical conductor. The signals may include, for example, sensor readings that may be made by the sensor device 100.

Contact springs 120 may provide electrical continuity between EMA 140 and, for example, a terminal contained in

2

connector 110. Contact springs 120 may include an electrically conductive material (e.g., silver plating) that may be used to provide the electrical continuity.

Environmental seal 130 may provide a seal between, for example, connector 110 and housing 160. Environmental seal 130 may prevent, for example, contaminants (e.g., moisture, dirt), that may potentially affect a performance of the sensor device 100, from entering the sensor device 100.

EMA 140 may include, for example, a circuit board and one or more electronic components 142 (e.g., integrated circuits, transistors, resistors, capacitors, inductors, diodes). The circuit board may be a printed circuit board (PCB). The electronic components may be mounted on the circuit board. The electronic components may, for example, process conditions (e.g., forces) sensed by sense element assembly 170 and/or generate signals based on the sensed conditions. The electronic components may include components that may transfer the generated signals to an external source via a terminal that may be contained in connector 110.

Housing 160 may provide a mounting platform for the clip-in support ring 200. Housing 160 may be made of a metal that may enable clip-in support ring 200 to be affixed (e.g., welded) to the housing 160. In an embodiment, housing 160 is shaped as a hexagonal cup.

Sense element assembly 170 may include provisions for sensing conditions such as, for example, conditions applied to the sensor device 100. Sense element assembly 170 may include for example, strain gauges 172 that may be used to sense various forces that may be applied to the sensor device 100.

Conditions sensed by sense element assembly 170 may be detected by circuitry contained on EMA 140. The circuitry may process the sensed conditions and generate various signals based on the processed sensed conditions. The signals may be transferred from the sensor device 100 to an external source via a terminal contained in connector 110.

Clip-in support ring 200 may be a support ring that may secure EMA 140 in sensor device 100. Specifically, EMA 140 may be loaded onto clip-in support ring 200. Afterwards, clip-in support ring 200 may be affixed to housing 160, thereby, providing a secure support for EMA 140 in sensor device 100.

FIG. 2 illustrates an example embodiment of clip-in support ring 200. Referring to FIG. 2, clip-in support ring 200 may include, for example, hooks 220a-b, beams 230a-b, an arm 240, a first end 250a, a second end 250b, and pedestals 270a-c. Plane 260 may illustrate a primary plane of the clip-in support ring 200.

It should be noted that clip-in support ring 200 may include other features. For example, clip-in support ring 200 may include one or more legs. The legs may extend (e.g., protrude) downward from clip-in support ring 200. The legs may, for example, support clip-in support ring 200 when the clip-in support ring 200 is affixed to housing 160. The legs may make contact with housing 160 and provide electrical continuity between EMA 140 (after being loaded in clip-in support ring 200) and housing 160. Examples of legs that may be used with clip-in support ring 200 will be described further below. Hooks 220a-b may extend upward from clip-in support ring 200 at the first end 250a. Hooks 220a-b may provide a force to EMA 140 that in combination with a force provided by arm 240 may hold EMA 140 in place in the clip-in support ring 200. As will be described further below, the force provided by hooks 220a-b may be, for example, a reaction force that may be applied to EMA 140 in response to a spring force that may be applied to EMA 140 by arm 240.

3

It should be noted that while two hooks **220a-b** are illustrated in FIG. 2, other embodiments of clip-in support ring **200** may include other numbers of hooks **220**. For example, in other embodiments, clip-in support ring **200** may include one hook **220** or more than two hooks **220**.

Beams **230a-b** may be in plane **260** and located between the first end **250a** and the second end **250b**. Beams **230a-b** may have widths that are smaller than widths of the first end **250a** and/or the second end **250b**. Beams **230a-b** may be compliant (e.g., flexible) and may provide a reaction force to EMA **140** after the EMA **140** is loaded in clip-in support ring **200**. A flexibility of beams **230a-b** may, however, be restricted (e.g., locked out) after, for example, the clip-in support ring **200** is loaded with EMA **140** and the clip-in support ring **200** is affixed to housing **160**.

Arm **240** may be located at the second end **250b**. Arm **240** may include a first portion **242a** and a second portion **242b**. The first portion **242a** may extend downwards from plane **260**. The second portion **242b** may extend upwards from an end of the first portion **242a** and cross plane **260** to extend upward above plane **260**. In an embodiment, the first portion **242a** and second portion **242b** may be shaped to form a “V”. It should be noted, however, that in other embodiments, the first portion **242a** and the second portion **242b** may be shaped to form other shapes (e.g., a semi-circle). Arm **240** may be compliant and may provide a spring force that may act as a clamping force for holding EMA **140** in place after the EMA **140** is loaded in the clip-in support ring **200**.

It should be noted that while one arm **240** is illustrated in FIG. 2, other embodiments of clip-in support ring **200** may include other numbers of arms **240**. For example, other embodiments of clip-in support ring **200** may include multiple arms **240**. Moreover, arms **240** in other embodiments of clip-in support ring **200** may be shaped differently than illustrated in FIG. 2.

Pedestals **270a-b** may provide, for example, support for EMA **140** after EMA **140** is loaded in clip-in support ring **200**. Moreover, pedestals **270a-b** may be provide electrical continuity between EMA **140** and clip-in support ring **200**.

As will be described further below, clip-in support ring **200** may be affixed to housing **160**. Affixing clip-in support ring **200** to housing **160** may provide electrical continuity between EMA **140** and housing **160** via clip-in support ring **200**. The electrical continuity may be provided, for example, via pedestals (e.g., pedestals **270a-b**) and/or legs that may be contained on clip-in support ring **200**.

FIG. 3 illustrates an example placement of EMA **140** in clip-in support ring **200** and FIG. 4 illustrates an operation of clip-in support ring **200**. Referring to FIG. 3, a first end of EMA **140** may, for example, include an opening to accommodate arm **240**. A second end of EMA **140** may, for example, be notched to accommodate hooks **220a-b**.

In operation, arm **240** and hooks **220a-b** may provide one or more forces that may be used to secure EMA **140** to clip-in support ring **200**. Referring now to FIG. 4, arm **240** may provide a spring force on the first end of the EMA **140**. The spring force may include one or more forces. For example, in an embodiment, the spring force may include a force in a lateral direction with respect to plane **260** and/or a force in a downward direction with respect to plane **260**.

In an embodiment, the spring force may be achieved by two compliant features of the clip-in support ring **200** in series. Here, for example, a first feature may include the compliant beams **230a-b** and a second feature in series with the first feature may include the stiffer formed yet compliant arm **240**.

Hooks **220a-b** may provide a reaction force on a second end of the EMA **140** opposite the first end of the EMA **140**.

4

The reaction force may be in reaction to the spring force provided by the arm **240**. A combination of the spring and reaction forces may secure the EMA **140** in the clip-in support ring **200**.

Loading EMA **140** in clip-in support ring **200** may be achieved, for example, by bending (e.g., bending in) plane **260** of the clip-in support ring **200**, which may be facilitated by beams **230a-b**. A sub-assembly process may include a fixture that may first bend the clip-in support ring **200** along the beams **230a-b** and then actuate or rotate arm **240** to obtain the situation of FIG. 3.

As noted above, clip-in support ring **200** may include one or more legs. An example of legs that may be used with clip-in support ring **200** include legs **420**. Legs **420** may be shaped, for example, as dimples that may extend downward from clip-in support ring **200**. The dimples may make contact with housing **160** after clip-in support ring **200** is placed in housing **160**.

It should be noted that the legs **420** illustrated in FIG. 4 are an example of a type of leg that may be used with clip-in support ring **200**. Other embodiments of clip-in support ring **200** may include other types of legs. For example, an embodiment of clip-in support ring **200** may include one or more prongs that may perform the function of legs **420**.

After loading EMA **140** in the clip-in support ring **200** the clip-in support ring **200** may be affixed (e.g., spot welded) to housing **160**. Affixing the clip-in support ring **200** to housing **160** may obviate bending of the beam **230a-b** and may result in a retention force that may keep the EMA **140** in place over an expected life of the sensor device **100**.

FIG. 5 illustrates an example technique for affixing the clip-in support ring **200** to housing **160** after the clip-in support ring **200** is loaded with EMA **140**. Referring to FIG. 5, the clip-in support ring **200** may be secured to the housing **160** by spot welding the clip-in support ring **200** to the housing **160** at various points **510a-c**. Note that points **510a-c** are examples of points where clip-in support ring **200** may be spot welded to housing **160**. In other embodiments, clip-in support ring **200** may be secured to housing **160** at other points on the clip-in support ring **200**. Moreover, it should be noted that in other embodiments, clip-in support ring **200** may be secured to housing **160** using techniques other than spot welding.

The foregoing description of embodiments is intended to provide illustration and description but is not intended to be exhaustive or to limit the invention to the precise form disclosed. Modifications and variations are possible in light of the above teachings or may be acquired from practice of the invention.

No element, act, or instruction used herein should be construed as critical or essential to the invention unless explicitly described as such. Also, as used herein, the article “a” is intended to include one or more items. Where only one item is intended, the term “one” or similar language is used. Further, the phrase “based on” is intended to mean “based, at least in part, on” unless explicitly stated otherwise.

What is claimed is:

1. A support ring comprising:

an arm at a first end of the support ring, the arm providing a spring force to an electronic module assembly (EMA) that is loaded in the support ring, the arm including: a first portion that extends downwards from a primary plane of the support ring, and a second portion extends upwards crossing the primary plane of the support ring; and

a hook at a second end of the support ring, the second end being opposite the first end, the hook providing a reaction force to the EMA that is in reaction to the spring force.

2. The support ring of claim 1, further comprising:
a first beam; and
a second beam,

wherein the first beam and the second beam are in a primary plane of the support ring and are located between the first end and the second end.

3. The support ring of claim 2, wherein the first beam and the second beam are compliant.

4. The support ring of claim 1, wherein the spring force provided by the arm includes a force in a lateral direction with respect to a primary plane of the support ring.

5. The support ring of claim 1, wherein the spring force provided by the arm includes a force in a downward direction with respect to a primary plane of the support ring.

6. The support ring of claim 1, wherein the hook extends upward from the support ring.

7. The support ring of claim 1, further comprising:
a leg that extends downward from the support ring.

8. The support ring of claim 7, wherein the leg is a dimple.

9. The support ring of claim 1, wherein the support ring is affixed to a housing of a sensor device.

10. The support ring of claim 9, wherein the affixed support ring provides electrical continuity between the housing and the EMA.

11. The support ring of claim 9, wherein the sensor device includes a micro-strain gauge (MSG).

12. The support ring of claim 9, wherein the support ring is affixed to the housing by a spot weld.

* * * * *
